

Distribution of **all** interactions ($A^{(m),+}$, $A^{(m),-}$)

= **Generalizable** interactions distri. + **Non-generalizable** interactions distri.

The new AND criterion **misclassifies** some generalizable interactions as non-generalizable.

Caption: Using AND criterion to extract generalizable interactions. The distribution of generalizable interactions under the AND criterion remains decay-shaped. However, the AND criterion misclassifies some generalizable interactions as non-generalizable, leading to a non-generalizable distribution that contains more low-order interactions than that under the OR criterion.
