

Distribution of **all** interactions ($A^{(m),+}$, $A^{(m),-}$)

=

Distribution of **Generalizable** interactions

+

Distribution of **Non-generalizable** interactions

Caption: Using a new AND criterion to extract generalizable interactions. Results show that generalizable interaction distribution under the new AND criterion is still decay-shaped. However, the new AND criterion misclassifies some generalizable interactions as non-generalizable, causing the non-generalizable distribution to include more low-order interactions than under OR criterion.
